

Paytm Insurance — Claim Tracking UX Improvement

Product Case Study · Feature Prioritization & UX Research · Self-Initiated

Role PM Intern Candidate	Domain Insurance / Fintech	Tools Figma · RICE · Sheets	Type Self-Initiated Research
-----------------------------	-------------------------------	--------------------------------	---------------------------------

1. Problem Statement

Insurance users in India face a fundamental trust gap — not at policy purchase, but **after a claim is filed**. The experience across major platforms is defined by silence: no real-time milestones, no ETA, and no unified dashboard across policy types. This drives repeated customer-care calls and erodes trust in digital insurance.

2. Competitor Analysis — Claim UX Audit

Platform	Strength	Key Pain Point	Gap
PolicyBazaar	Strong discovery & comparison engine	Claim tracking buried 3+ taps; no status timeline	Post-purchase experience weak
ACKO	Digital-first; no surveyor for minor claims	Sparse push notifications; no ETA shown post-filing	Settlement timeline transparency
Paytm Insurance	Large user base & payments trust	Redirects to third-party insurer portals mid-claim	No unified claim dashboard

3. User Pain Points Identified

1. No real-time status updates

Users left in the dark; no progress milestones or ETAs communicated after filing.

2. Broken in-app journeys

Paytm redirects mid-claim to external insurer portals, destroying continuity.

3. High customer-care dependency

No self-serve status tracking forces repeated calls, inflating support costs.

4. Document re-submission friction

No in-app upload; users resort to email/WhatsApp, causing delays and drop-offs.

4. Proposed Solution — Unified Claim Tracker

Milestone Progress Bar Step tracker: Filed > Under Review > Approved > Settled — with timestamps at each stage.

In-App Document Upload Upload supporting docs directly without leaving Paytm — removes the #1 friction point.

Proactive Push Notifications Automated alerts at every stage transition plus an estimated resolution date.

5. Feature Prioritization — RICE Framework

RICE Score = (Reach x Impact x Confidence) / Effort. Higher score = higher priority.

Feature	Reach	Impact	Confidence	Effort	RICE	Rank
In-App Document Upload	Medium	High	90%	Low (2)	27	#1
Milestone Status Tracker	High	High	80%	Med (4)	24	#2

Proactive Push Notifs	High	Med	85%	Low (2)	21	#3
-----------------------	------	-----	-----	---------	----	----

6. Success Metrics (North Star KPIs)

7. Key Learnings

- Post-purchase experience is the highest-impact PM opportunity in Indian insurance — almost no platform does it well.
- In-app document upload has the best effort-to-impact ratio: low engineering cost, directly removes the top friction point.
- Transparency beats speed — users tolerate claim delays if they receive regular, honest status updates.
- Paytm's aggregator model creates a unique challenge: good UX requires deep insurer API integration, not just UI work.
